Habitat group: **coastal habitats**
 Regions: **ATL BOR CON MED**

Assessments of conservation status at the European level (all biogeographical regions - EU25)

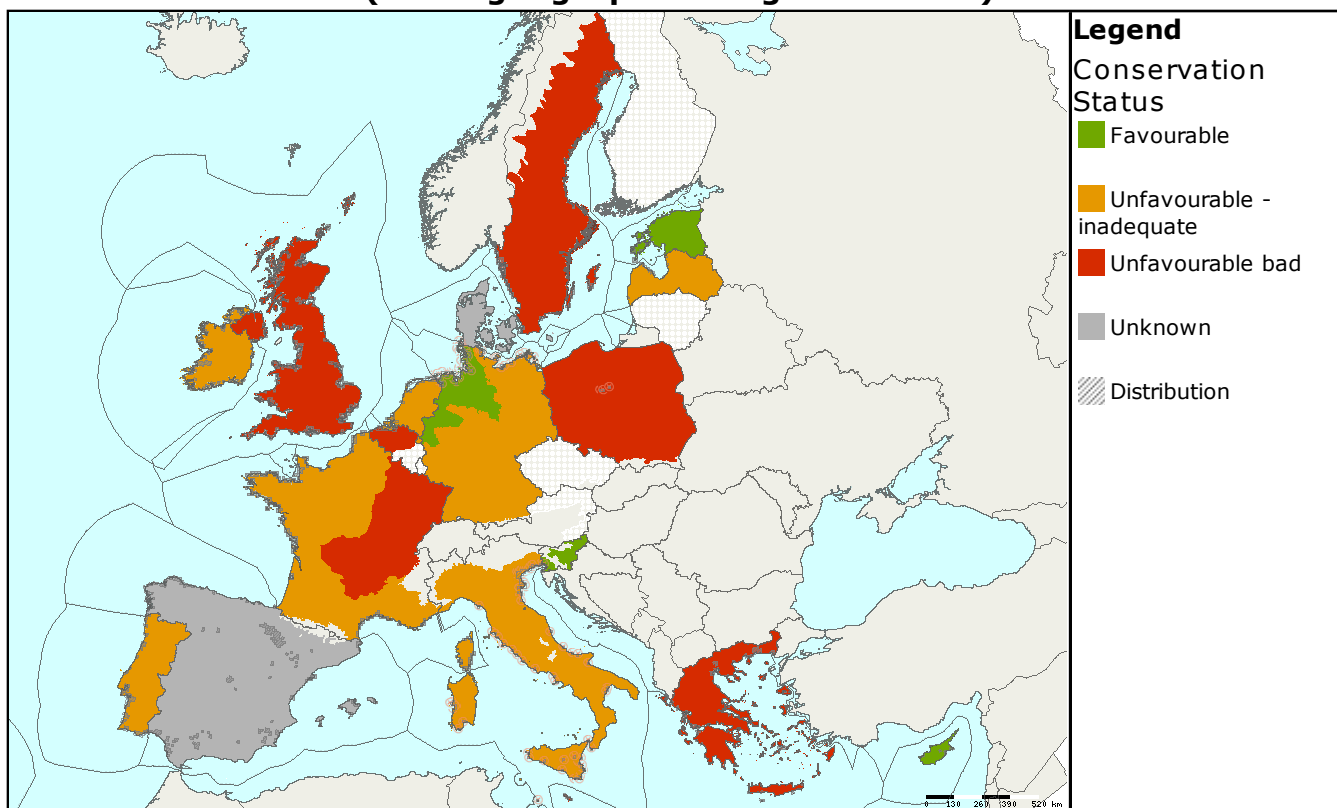

MS	Biogeographic Region	Conservation status assessment					Km ²	Trend in area
		Range	Area	Structure & function	Future prospects	Overall		
EU25	ATL	Green	Orange	Orange	Orange	Orange	>224	x
EU25	BOR	Green	Grey	Green	Orange	Orange	7.32	-
EU25	CON	Green	Orange	Grey	Grey	Orange	34	x
EU25	MED	Red	Grey	Grey	Grey	Red	>169	x

Salicornia is a genus of succulent plants typical of coastal muds and sands covered at high tide, the group includes plants such as marsh samphire (*Salicornia europaea*). The habitat can often form part of saltmarshes and is widespread along all European coasts except in Macaronesia. The habitat can also occur inland on saline soils as in Poland, Spain and Romania.

Few countries have assessed this habitat as 'favourable' and it has been assessed as 'unfavourable-inadequate' in all regions except for the Mediterranean where it is 'unfavourable-bad'. Range is generally favourable but the other parameters are widely reported as unfavourable due to human impacts, sometimes noted as linked to land reclamation.

Although the habitat is clearly unfavourable in the Mediterranean region, there are many problems with the data reported by the member states and better data is required.

Assessments of conservation status as reported by Member states (all biogeographical regions - EU25)

Data quality is based on an assessment by each Member State, 1 = good, 2 = medium, 3 = poor

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2007 and covering the period 2001-2006. More detailed information is available at <http://biodiversity.eionet.europa.eu/article17>
