Central European calcareous or marl scree, often in warm and dry areas occurring on hills and mountains from northern France to Hungary and locally in central Italy. This is a rare and priority form of habitat type 8130 Western Mediterranean and thermophilous scree

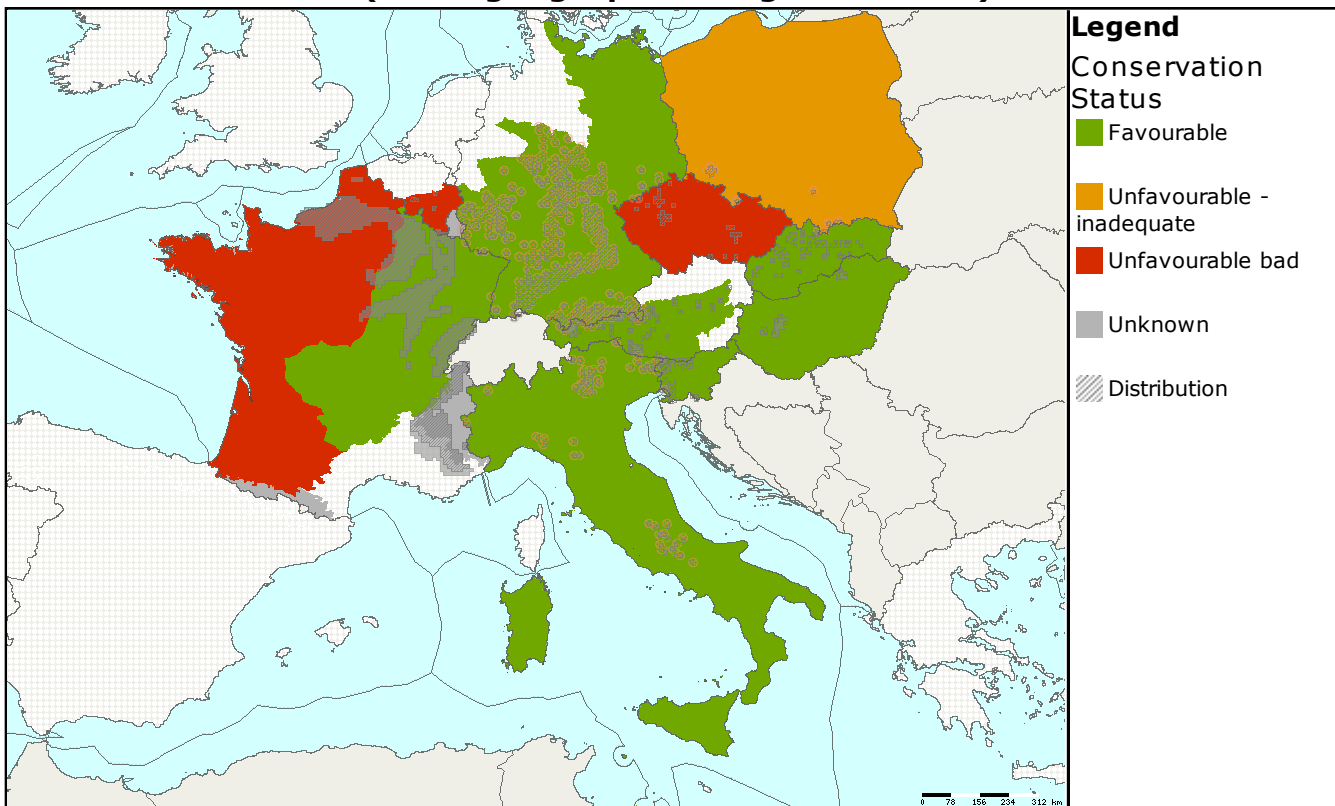

Assessed as 'favourable' for the Alpine, Continental, Mediterranean and Pannonic regions although some countries report 'unfavourable-bad' (e.g. Belgium and Czech Republic). Assessed as 'unfavourable-bad' in the Atlantic region (France only) suggesting that the habitat is favourable in its core area but not at its western (Belgium, France) or eastern (Czech Republic, Poland) limits. Several countries reported one or more parameters as 'unknown'.

A variety of threats and pressures have been reported but many countries mention

mineral extraction.

Better information required, particularly from Luxembourg and the French Alpine region.
