

Species name: **Podarcis hispanica atrata**
Annex: **IV**

Species group: **Amphibians & Reptiles**
Regions: **MED**

Assessments of conservation status at the European level (all biogeographical regions - EU25)

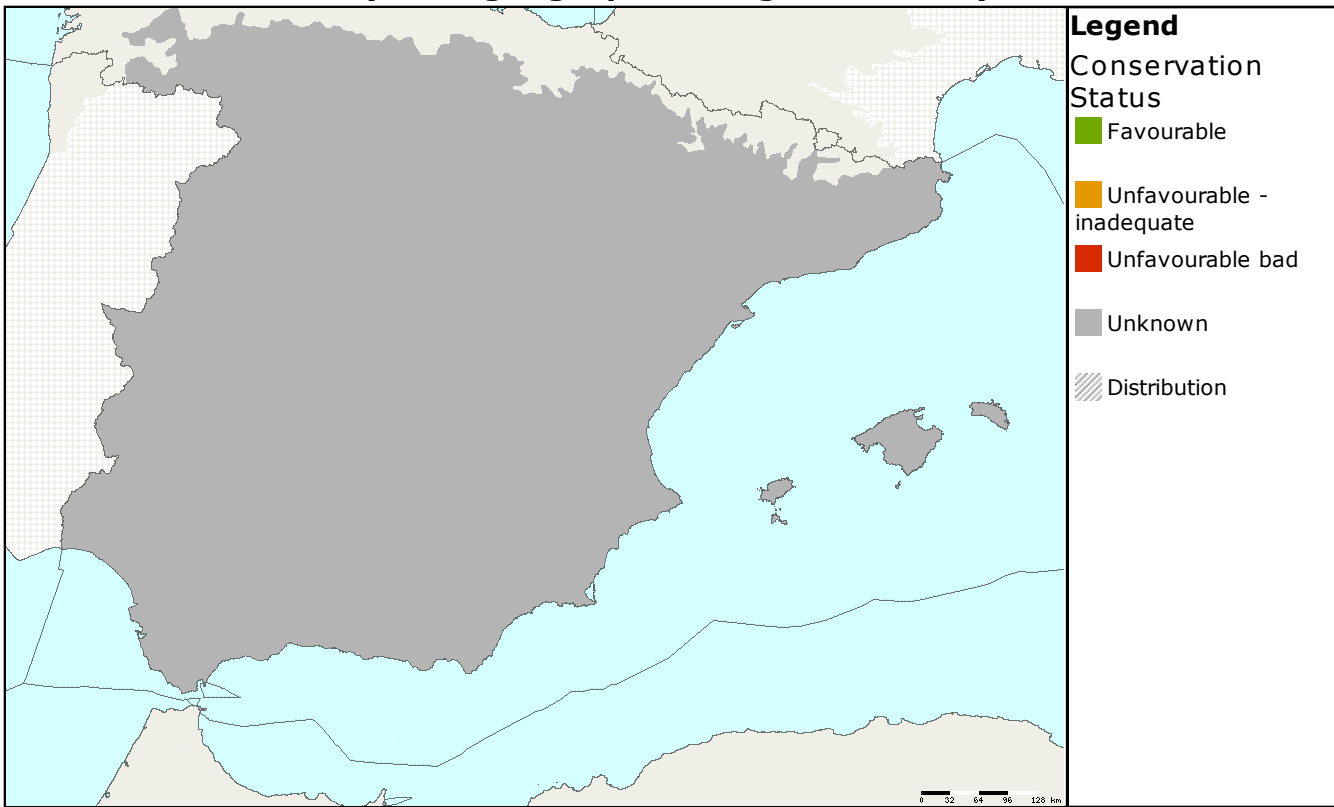

MS	Region	Conservation status assessment					Population size & unit	Population Trend
		Range	Population	Habitat	Future prospects	Overall		
EU25	MED							

Previously a subspecies of the Iberian Wall Lizard, now widely accepted as unique species. It is endemic to uninhabited Columbretes islands in the Mediterranean Sea of Spain. The particular habitat of the species is unknown, but as the other lizards it inhabits rocky slopes or rock outcrops.

It was reported only from the Mediterranean biogeographical region. The conservation status is 'unknown'. The information on the status of this species and on the threats is scarce. The distribution of the subspecies is very restricted. That is why it is considered 'vulnerable' in Spain.

Assessments of conservation status as reported by Member states (all biogeographical regions - EU25)

MS	Region	Conservation status assessment					Size&unit	Population trend	Data quality
		Range	Population	Habitat	Future prospects	Overall			
ES	MED						N/A x	N/A	

Data quality is based on an assessment by each Member State, 1 = good, 2 = medium, 3 = poor

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2007 and covering the period 2001-2006. More detailed information is available at <http://biodiversity.eionet.europa.eu/article17>
