The marsh fritillary is a butterfly distributed across six biogeographical regions of Europe. It can be found on different kinds of grasslands. Main threats are changes in land use practices especially in use of grasslands.

The species is assessed as 'unfavourable-inadequate' in Alpine, Boreal and Pannonian regions and 'inadequate-bad' in Atlantic and Continental. For Poland species is reported 'extinct'. For Mediterranean region there is no data available in the majority of countries and in the majority of the distribution areas, therefore its overall assessment is 'unknown'.

However, species is assessed as 'favourable' in several countries across Europe: Germany, France, Italy, Latvia and Sweden.
