The woodland brown is a butterfly widely distributed, but uncommon and local in continental Europe. Most of the suitable habitats for the species have been transformed to gardening. It may be found in warm openings of damp unmanaged mature forests.

Its conservation status is 'unfavourable-bad' in Atlantic, Continental, Alpine and Pannonian regions even if all parameters reported by Italy and Slovenia are 'favourable'. Only France is reporting for the Mediterranean region and all parameters are 'unknown'. In Boreal region, despite 'favourable' assessments by Lithuania and Latvia, the overall status is 'unfavourable-inadequate' because of negative Swedish report.

Assessments of conservation status as reported by Member states (all biogeographical regions - EU25)

Data quality is based on an assessment by each Member State, 1 = good, 2 = medium, 3 = poor

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2007 and covering the period 2001-2006. More detailed information is available at <http://biodiversity.eionet.europa.eu/article17>
