

Species name: **Marmota marmota latirostris** Species group: **Mammals**  
 Annex: **II\*, IV** Regions: **ALP MED**

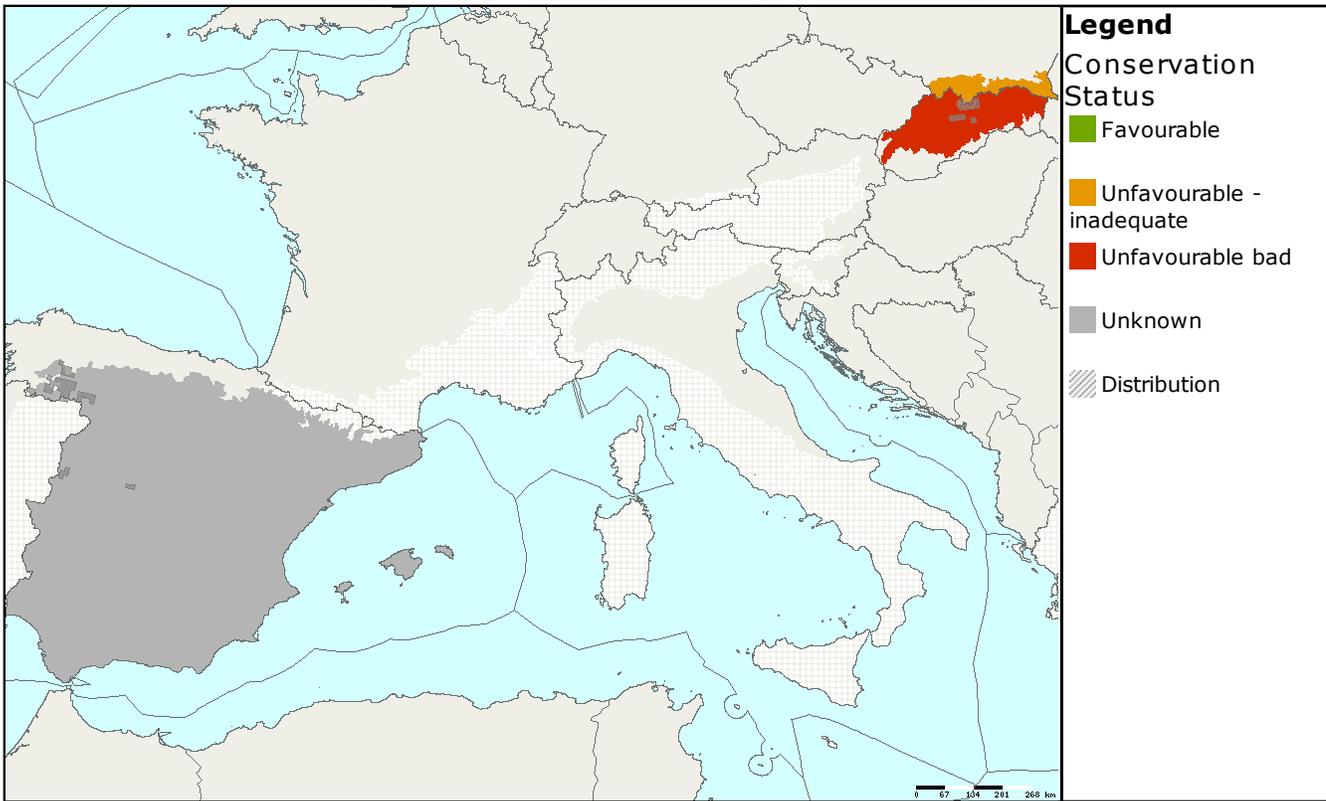

## Assessments of conservation status at the European level (all biogeographical regions - EU25)

MS	Region	Conservation status assessment					Population size & unit	Population Trend
		Range	Population	Habitat	Future prospects	Overall		
EU25	ALP	Unfavourable bad	Unfavourable bad	Unfavourable - inadequate	Unfavourable bad	Unfavourable bad	16 grids	-

The Tatra marmot is endemic subspecies for Tatra Mountains. It is recorded from Alpine biogeographical region by Poland and Slovakia. Its overall assessment for the region is 'unfavourable-bad' based on Slovakian report which is 'unfavourable-bad' in three parameters (range, population and future prospects). Its populations in Slovakia (80, 5 % of population map) are small and mutually isolated. Poland assessed this species in three parameters (range, habitat and future prospects) as 'favourable'. According to IUCN Red List data, this subspecies of Alpine marmot has restricted range and small population, and should be monitored and protected.

## Assessments of conservation status as reported by Member states (all biogeographical regions - EU25)

MS	Region	Conservation status assessment					Size&unit	Population trend	Data quality
		Range	Population	Habitat	Future prospects	Overall			
PL	ALP						40 - 50 colony	=	2
SK	ALP						800 - 1000 indiv.	-	2
ES	MED						N/A x	X	

Data quality is based on as assessment by each Member State, 1 = good, 2 = medium, 3 = poor

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2007 and covering the period 2001-2006. More detailed information is available at <http://biodiversity.eionet.europa.eu/article17>
