

Species name: **Nyctalus leisleri**
Annex: **IV**

Species group: **Mammals**
Regions: **ALP ATL BOR CON MAC MED PAN**

Assessments of conservation status at the European level (all biogeographical regions - EU25)

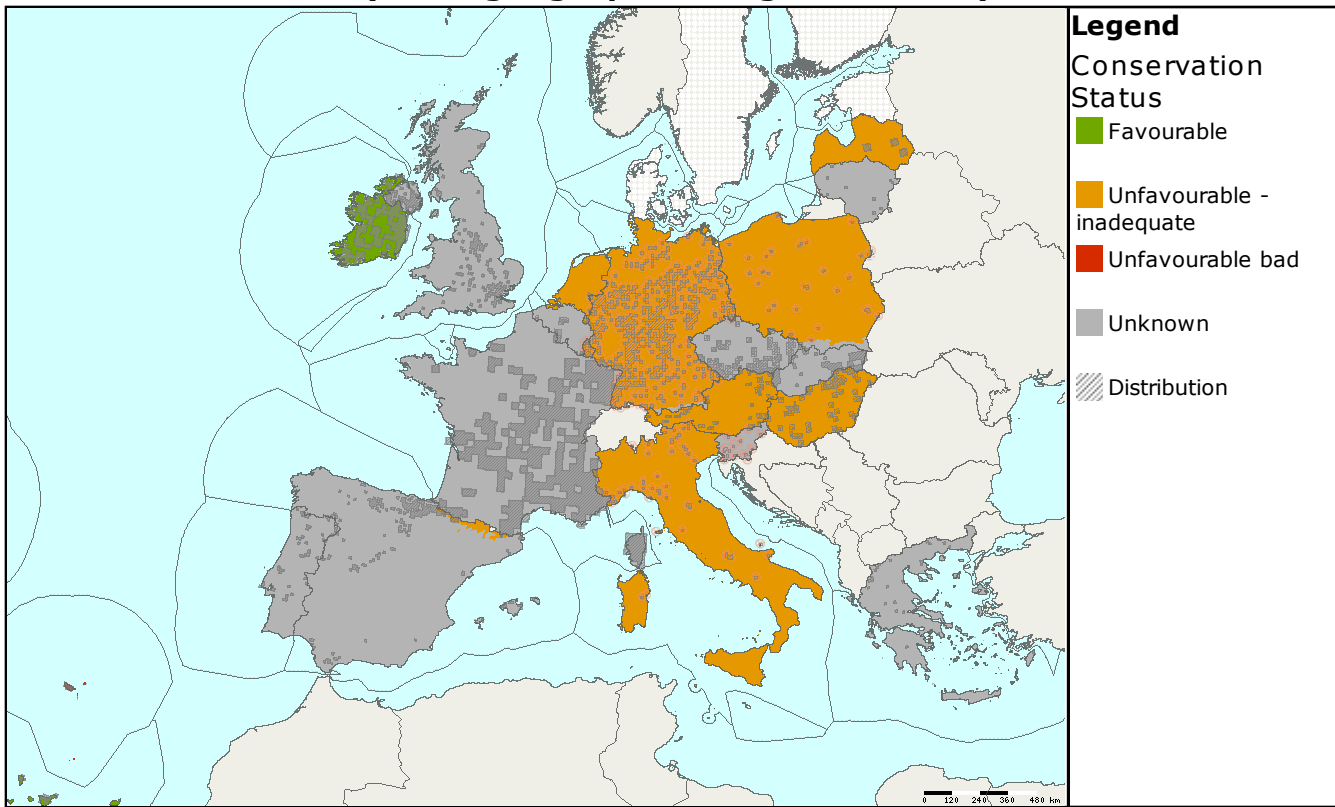

MS	Region	Conservation status assessment					Population size & unit	Population Trend
		Range	Population	Habitat	Future prospects	Overall		
EU25	ALP						520 grids	
EU25	BOR						37 grids	X
EU25	CON						2310 grids	
EU25	MAC						26 grids	
EU25	MED						872 grids	
EU25	PAN						308 grids	
EU25	ATL						1494 grids	

The Leisler's bat is widely distributed all across the Europe, with its northern limit in Ireland and Baltic states. It uses various habitat types but nests in cavities in old trees. That is why forestry clearance and removal of dead and dying trees, together with use of pesticides is reported as one of the main threats in all country reports.

Many countries reported individual parameters and the overall assessment as 'unknown' showing a need for better information. Overall assessments are mostly 'unknown' but 'not favourable', except in Ireland where it is 'favourable' and in Estonia and Hungary where future prospects are assessed as 'favourable'.

Interestingly, it is classified as 'least concern' in Europe by IUCN, thus further stressing the need for better information to be provided by the Member States.

**Assessments of conservation status as reported by Member states
(all biogeographical regions - EU25)**

MS	Region	Conservation status assessment					Size&unit	Population trend	Data quality
		Range	Population	Habitat	Future prospects	Overall			
AT	ALP						23 - 23 grids	X	3
DE	ALP						2 - (2) x	X	3
ES	ALP						13 - 13 loc.	-	3
