Savi's pipistrelle is a bat widely distributed in the Palearctic, extending from southern Europe and north Africa through the Middle East and the Caucasus. It forages over open woodland, pasture and wetlands, and often feeds at lights in rural areas, towns and cities.

Many individual parameters are reported as 'unknown' by the countries, showing that better information is required for the species. Its status of conservation is 'unknown' in four of the six biogeographical regions where it occurs. In Pannonian and Macaronesian regions the overall assessment is 'favourable', with only Spain reporting for Macaronesian region.

The species is widespread and abundant and there is no evidence of population decline. Consequently it is assessed as 'Least Concern' by IUCN.
