

Species name: **Stenella frontalis**
Annex: **IV**

Species group: **Mammals**
Regions: **MMAC**

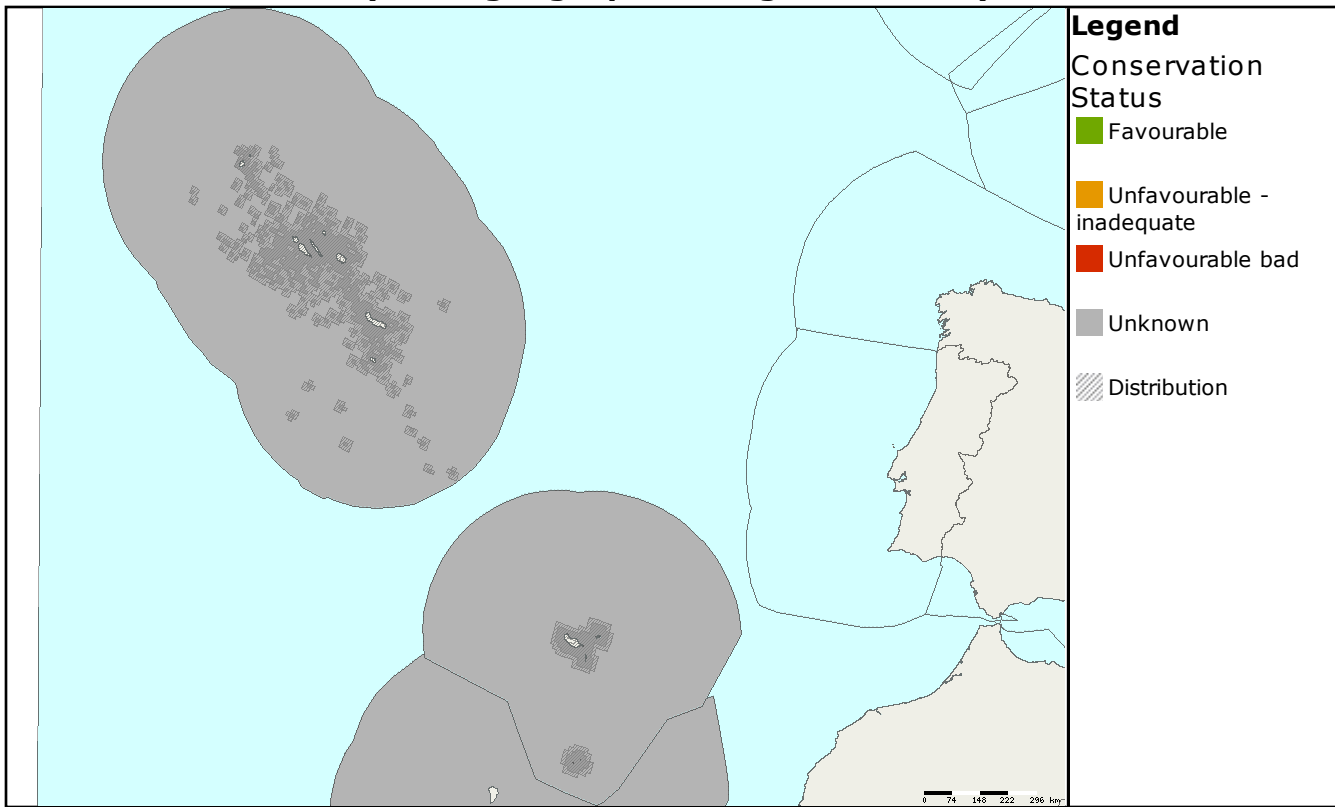

Assessments of conservation status at the European level (all biogeographical regions - EU25)

MS	Region	Conservation status assessment					Population size & unit	Population Trend
		Range	Population	Habitat	Future prospects	Overall		
EU25	MMAC							

The Atlantic spotted dolphin inhabits continental and deep oceanic waters of the mid-tropical Atlantic. Its range and abundance are however still very unknown. The overall marine Macaronesian region assessment is 'unknown' even though some sighting frequency data for the island of Madeira indicates the presence of numerous individuals from Spring-Autumn. The species' knowledge gap on its conservation status reflects its global listing as 'data deficient' in the IUCN Red List of threatened species.

Assessments of conservation status as reported by Member states (all biogeographical regions - EU25)

MS	Region	Conservation status assessment					Size&unit	Population trend	Data quality
		Range	Population	Habitat	Future prospects	Overall			
ES	MMAC						N/A x	X	
PT	MMAC						N/A x	X	

Data quality is based on an assessment by each Member State, 1 = good, 2 = medium, 3 = poor

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2007 and covering the period 2001-2006. More detailed information is available at
