

Species name: **Artemisia pancicii**
Annex: **II*, IV**

Species group: **Plants**
Regions: **CON PAN**

Assessments of conservation status at the European level (all biogeographical regions - EU25)

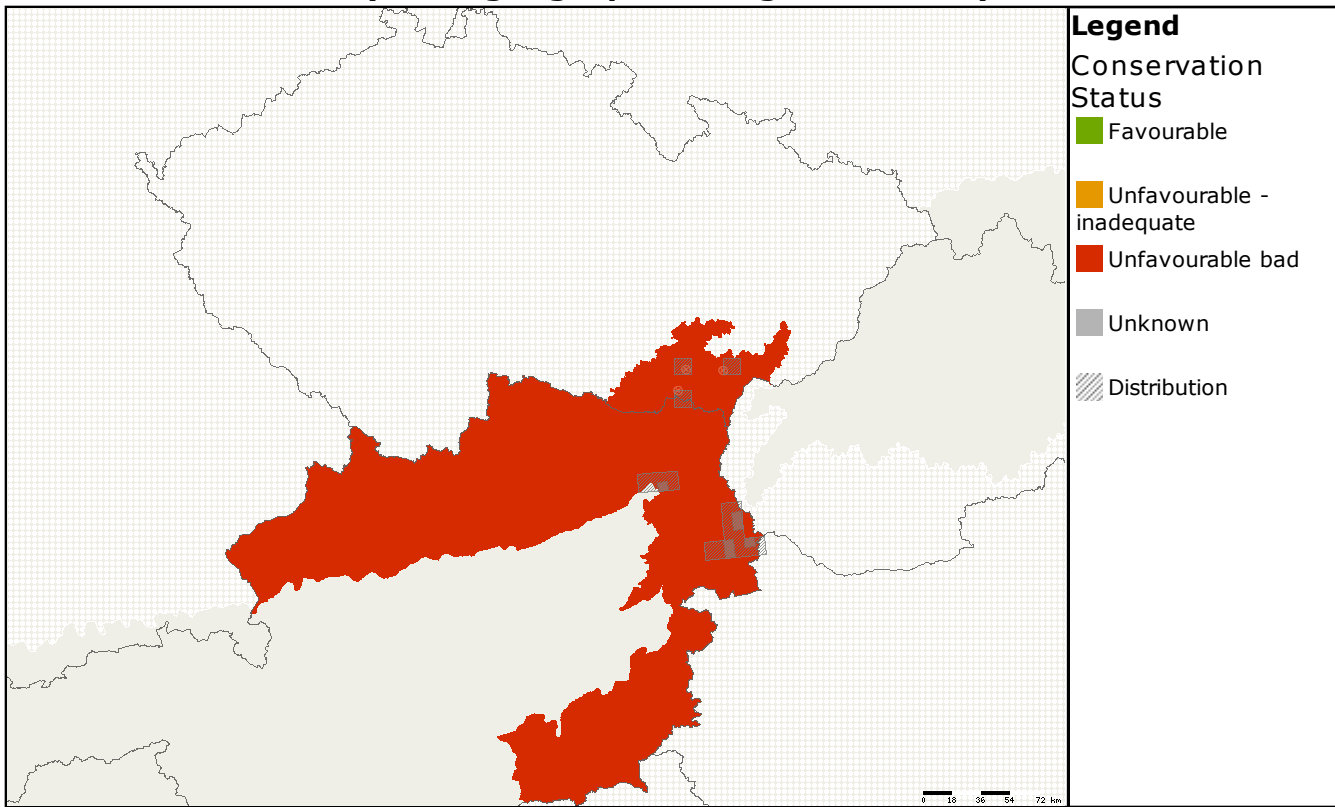

MS	Region	Conservation status assessment					Population size & unit	Population Trend
		Range	Population	Habitat	Future prospects	Overall		
EU25	CON	Unfavourable - inadequate	Unfavourable - inadequate	Unfavourable bad	Unfavourable - inadequate	Unfavourable bad	500 - 1000 indiv.	-
EU25	PAN	Favourable	Unfavourable bad	Unfavourable bad	Unfavourable bad	Unfavourable bad	40000 shoots	X

A Pannonian endemic wormwood with a dispersed natural range, occurring in a few isolated localities in Czech Republic, Austria and Serbia. It grows in steppic grassland and on edges of the shrub formations on the southern slopes on basic substrates or on loess.

The conservation status in both biogeographical regions is 'unfavourable bad'. In the Continental biogeographical region it is largely the consequence of the decrease in the extent of the already small habitat area. In the Pannonian biogeographical region besides the decrease in the habitat area, populations suffer from isolation and limited size, genetic variability is low and populations are not fertile.

**Assessments of conservation status as reported by Member states
(all biogeographical regions - EU25)**

MS	Region	Conservation status assessment					Size&unit	Population trend	Data quality
		Range	Population	Habitat	Future prospects	Overall			
AT	CON	Yellow	Yellow	Red	Yellow	Red	500 - 1000 indiv.	-	2
CZ	PAN	Green	Red	Red	Red	Red	40000 - 40000 shoots	X	1

Data quality is based on as assessment by each Member State, 1 = good, 2 = medium, 3 = poor

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2007 and covering the period 2001-2006. More detailed information is available at
