European Environment Agency European Topic Centre on Biological Diversity

Rupicapra pyrenaica ornata

Annex	II, IV
Priority	Yes
Species group	Mammals
Regions	Alpine

The Apennine Chamois is found in alpine meadows, rocky areas, and the forested valleys and lower slopes in mountainous regions.

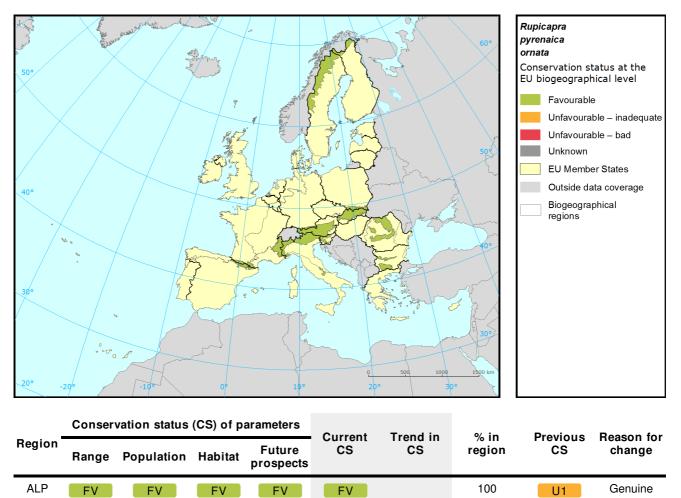

This subspecies can be considered marginal for Mediterranean region and therefore the full reporting was compiled by Italian authorities only for the Alpine region. The historical population of Abruzzo, Lazio and Molise National Park has negative trend while the new areas (Gran Sasso-Laga National Park and Majella National Park) show positive trends in Range and Population, reasons why Conservation Status has changed from 'Unfavourable-Inadequate' in 2001-2206 to 'Favourable'.

Main threats are interspecific competition with red deer (*Cervus elaphus*) and habitat shifting and alteration.

The subspecies is classified by IUCN as 'Vulnerable' (http://www.iucnredlist.org/details/19771/1 consulted on 25 April 2014).

Report under the Article 17 of the Habitats Directive

Assessment of conservation status at the European biogeographical level

See the endnote for more informationⁱ

Report under the Article 17 of the Habitats Directive

Assessment of conservation status at the Member State level

Rupicapra pyrenaica ornata				
Distribution and conservation status at the Member State level				
Favourable Unfavourable – inadequate Unfavourable – bad Unknown	EU Member States Outside data coverage Biogeographical region			

The map shows both Conservation Status and distribution using a 10 km x 10 km grid. Conservation status is assessed at biogeographical level. Therefore the representation in each grid cell is only illustrative.

Report under the Article 17 of the Habitats Directive

		Conservation status of parameters				Current Tro	Trend in	% in	Previous	Reason
MS Region	Range	Population	Habitat	Future prospects	Current CS	CS	region	CS	for change	
IT	ALP	FV	FV	FV	FV	FV		100.0	U1+	Genuine

Knowing that not all changes in conservation status between the reporting periods were genuine, Member States were asked to give the reasons for changes in conservation status. Bulgaria and Romania only joined the EU in 2007 and Greece did not report for 2007-12 so no reason is given for change for these countries. Greek data shown above is from 2001-06.

Main pressures and threats reported by Member States

Member States were asked to report the 20 most important threats and pressures using an agreed hierarchical list which can be found on the Article 17 Reference Portal. Pressures are activities which are currently having an impact on the species and threats are activities expected to have an impact in the near future. Pressures and threats were ranked in three classes 'high, medium and low importance'; the tables below only show threats and pressures classed as 'high', for some species there were less than ten threats or pressures reported as highly important.

Ten most frequently reported 'highly important' pressures

Code	Activity	Frequency
M02	Biotic changes (climate change)	100

Ten most frequently reported 'highly important' threats

Code	Activity	Frequency
K03	Interspecific faunal relations	50
M02	Biotic changes (climate change)	50

Proportion of population covered by the Natura 2000 network

For species listed in the Annex II of the Directive Member States were asked to report the population size within the Natura 2000 network. The percentage of species population covered by the network was estimated by comparing the population size within the network and the total population size in the biogeographical/marine region.

Percentage of coverage by Natura 2000 sites in biogeographical/marine region

See the endnotes for more informationⁱⁱ

Report under the Article 17 of the Habitats Directive

Most frequently reported conservation measures

For species listed in the Annex II of the Directive Member States were asked to report up to 20 conservation measures being implemented for this species using an agreed list which can be found on the Article 17 Reference Portal. Member States were further requested to highlight up to five most important ('highly important') measures; the table below only shows measures classed as 'high', for many species there were less than ten measures reported as highly important.

Ten most frequently reported 'highly important' conservation measures

Code Measure

Frequency

No 'highly important' measures were reported.

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2013 and covering the period 2007-2012. More detailed information, including the MS reports, is available at: http://bd.eionet.europa.eu/article17/reports2012/species/summary/? group=Mammals&period=3&subject=Rupicapra+pyrenaica+ornata

Report under the Article 17 of the Habitats Directive

¹Assessment of conservation status at the European biogeographical level: Current Conservation Status (Current CS) shows the status for the reporting period 2007-2012, Previous Conservation Status (Previous CS) for the reporting period 2000-2006. Reason for change in conservation status between the reporting periods indicates whether the changes in the status were genuine or not genuine. Previous Conservation Status was not assessed for Steppic, Black Sea and Marine Black Sea regions. For these regions the Previous status is therefore considered as 'unknown'. The percentage of the species population occurring within the biogeographical/marine region (% in region) is calculated based on the area of GIS distribution.

^{II}Percentage of coverage by Natura 2000 sites in biogeographical/marine region: In some cases the population size within the Natura 2000 network has been estimated using a different methodology to the estimate of overall population size and this can lead to percentage covers greater than 100%. In such case the value has been given as 100% and highlighted with an asterisk (*). The value 'x' indicates that the Member State has not reported the species population and/or the coverage by Natura 2000. No information is available for Greece. The values are only provided for regions, in which the occurrence of the species has been reported by the Member States.
