

Orthotrichum rogeri

Annex	II
Priority	No
Species group	Non-vascular plants
Regions	Alpine, Atlantic, Boreal, Continental

Orthotrichum rogeri is a moss that builds small, tufts, with obtuse leaves and an immersed/emergent capsule. The distribution is Oceanic-montane and the largest populations are found in central Europe. The species is redlisted in nearly all Member States. In Europe considered as Vulnerable (VU) by criterion B1,2cd.

The conservation status in Alpine, Atlantic and Boreal region is "Unfavourable Bad" and in Continental region "Unfavourable Inadequate". Trends is stable in Boreal and Continental region, unknown in Alpine and positive in Atlantic region.

It is threatened by felling of trees during programmes of building and road construction and as part of commercial forest management. Air pollution is a general threat to many species of *Orthotrichum*.

Changes in overall conservation status between 2001-06 and 2007-12 report are mostly caused by different methodical approach and better data rather than real change in conservation status in Atlantic and Continental region. No changes in overall conservation status between 2001-06 and 2007-12 reports in Alpine and Boreal region.

Better data is required from Czech republic, France, Italy, Spain and Sweden.

Species: *Orthotrichum rogeri*
Report under the Article 17 of the Habitats Directive

Assessment of conservation status at the European biogeographical level

Region	Conservation status (CS) of parameters				Current CS	Trend in CS	% in region	Previous CS	Reason for change
	Range	Population	Habitat	Future prospects					
ALP	XX	XX	XX	XX	U2	x	22	U2	
ATL	U2	FV	FV	FV	U2	+	7	U1	Not genuine
BOR	U2	U2	XX	XX	U2	=		U2	
CON	FV	FV	FV	U1	U1	=	71	XX	Not genuine

FR	CON	FV	FV	FV	U1	U1	=	30.4	U1	
IT	CON	U1	U1	U1	U1	U1	-	0.9		

Knowing that not all changes in conservation status between the reporting periods were genuine, Member States were asked to give the reasons for changes in conservation status. Bulgaria and Romania only joined the EU in 2007 and Greece did not report for 2007-12 so no reason is given for change for these countries. Greek data shown above is from 2001-06.

Main pressures and threats reported by Member States

Member States were asked to report the 20 most important threats and pressures using an agreed hierarchical list which can be found on the [Article 17 Reference Portal](#). Pressures are activities which are currently having an impact on the species and threats are activities expected to have an impact in the near future. Pressures and threats were ranked in three classes 'high, medium and low importance'; the tables below only show threats and pressures classed as 'high', for some species there were less than ten threats or pressures reported as highly important.

Ten most frequently reported 'highly important' pressures

Code	Activity	Frequency
B02	Forest and plantation management & use	40
K02	Vegetation succession/Biocenotic evolution	40
H04	Air pollution, air-borne pollutants	20

Ten most frequently reported 'highly important' threats

Code	Activity	Frequency
B02	Forest and plantation management & use	43
H04	Air pollution, air-borne pollutants	29
J02	Changes in water bodies conditions	14
K02	Vegetation succession/Biocenotic evolution	14

Proportion of population covered by the Natura 2000 network

For species listed in the Annex II of the Directive Member States were asked to report the population size within the Natura 2000 network. The percentage of species population covered by the network was estimated by comparing the population size within the network and the total population size in the biogeographical/marine region.

Percentage of coverage by Natura 2000 sites in biogeographical/marine region

	ALP	ATL	BOR	CON
AT	0			
CZ				0
DE		x		47
ES	40			
FR	22			x
IT	x			x
NL		100		
SE			0	

See the endnotes for more informationⁱⁱ

Most frequently reported conservation measures

For species listed in the Annex II of the Directive Member States were asked to report up to 20 conservation measures being implemented for this species using an agreed list which can be found on the Article 17 Reference Portal. Member States were further requested to highlight up to five most important ('highly important') measures; the table below only shows measures classed as 'high', for many species there were less than ten measures reported as highly important.

Ten most frequently reported 'highly important' conservation measures

Code	Measure	Frequency
6.3	Legal protection of habitats and species	50
3.1	Restoring/improving forest habitats	25
7.4	Specific single species or species group management measures	25

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2013 and covering the period 2007-2012. More detailed information, including the MS reports, is available at:
<http://bd.eionet.europa.eu/article17/reports2012/species/summary/?group=Non-vascular+plants&period=3&subject=Orthotrichum+rogeri>

Species: *Orthotrichum rogeri*

Report under the Article 17 of the Habitats Directive

i Assessment of conservation status at the European biogeographical level: Current Conservation Status (Current CS) shows the status for the reporting period 2007-2012, Previous Conservation Status (Previous CS) for the reporting period 2000-2006. Reason for change in conservation status between the reporting periods indicates whether the changes in the status were genuine or not genuine. Previous Conservation Status was not assessed for Steppic, Black Sea and Marine Black Sea regions. For these regions the Previous status is therefore considered as 'unknown'. The percentage of the species population occurring within the biogeographical/marine region (% in region) is calculated based on the area of GIS distribution.

ii Percentage of coverage by Natura 2000 sites in biogeographical/marine region: In some cases the population size within the Natura 2000 network has been estimated using a different methodology to the estimate of overall population size and this can lead to percentage covers greater than 100%. In such case the value has been given as 100% and highlighted with an asterisk (*). The value 'x' indicates that the Member State has not reported the species population and/or the coverage by Natura 2000. No information is available for Greece. The values are only provided for regions, in which the occurrence of the species has been reported by the Member States.
